

Noughts & Crosses – Algorythm

Create the webpage layout consisting on a basic 3x3 table.

Inside the table cells there will be links (<a> tags) which should take the whole cell space. Check how to make them fit the whole cell using CSS !!!!

When clicking on the links (onclick event !!!), call a mark function passing coordinate values mark(a,b). For example: mark(1,2) would mark cell 3 on the second row.

Algorythm

Global Click counter initialize.

Create the function using javascript:

if click number is lesser than 9 do {

 take the parameters a and b and compose a coordinate like ab. For example: a=2 b=0

 compose coordinate 20.

 if click count is pair{

 change the cell background to O. //Check how to change background image style using javascript.

 }

 else {

 change the cell background to X. //Check how to change background image style using javascript.

 }

 fit the background style image size.//Check how to change background image size using javascript.

 Update click counter by 1.

 }
